

Week 1- Learning Map

Goal:

By the end of Week 1, you will be able to set up the OpenAI client locally, make a secure API call, and understand what makes an AI system “agentic” (tools, memory, and decision logic).

You’ll apply this by building a Zapier-based customer support agent in class and designing a stateful incident detection agent as your assignment.

Overview...

Week 1 is focused on getting you unblocked and ready to build with LLMs and agents. The most important step is completing the mandatory setup.

Once your setup is complete, you can optionally go through pre-class resources to understand prompting and the fundamentals of agents, which will make the live session easier to follow.

During the live class, you will learn how to interact with LLMs, understand agent concepts, and build a Zapier E-commerce Customer Support Agent and connect core agent concepts to real workflows.

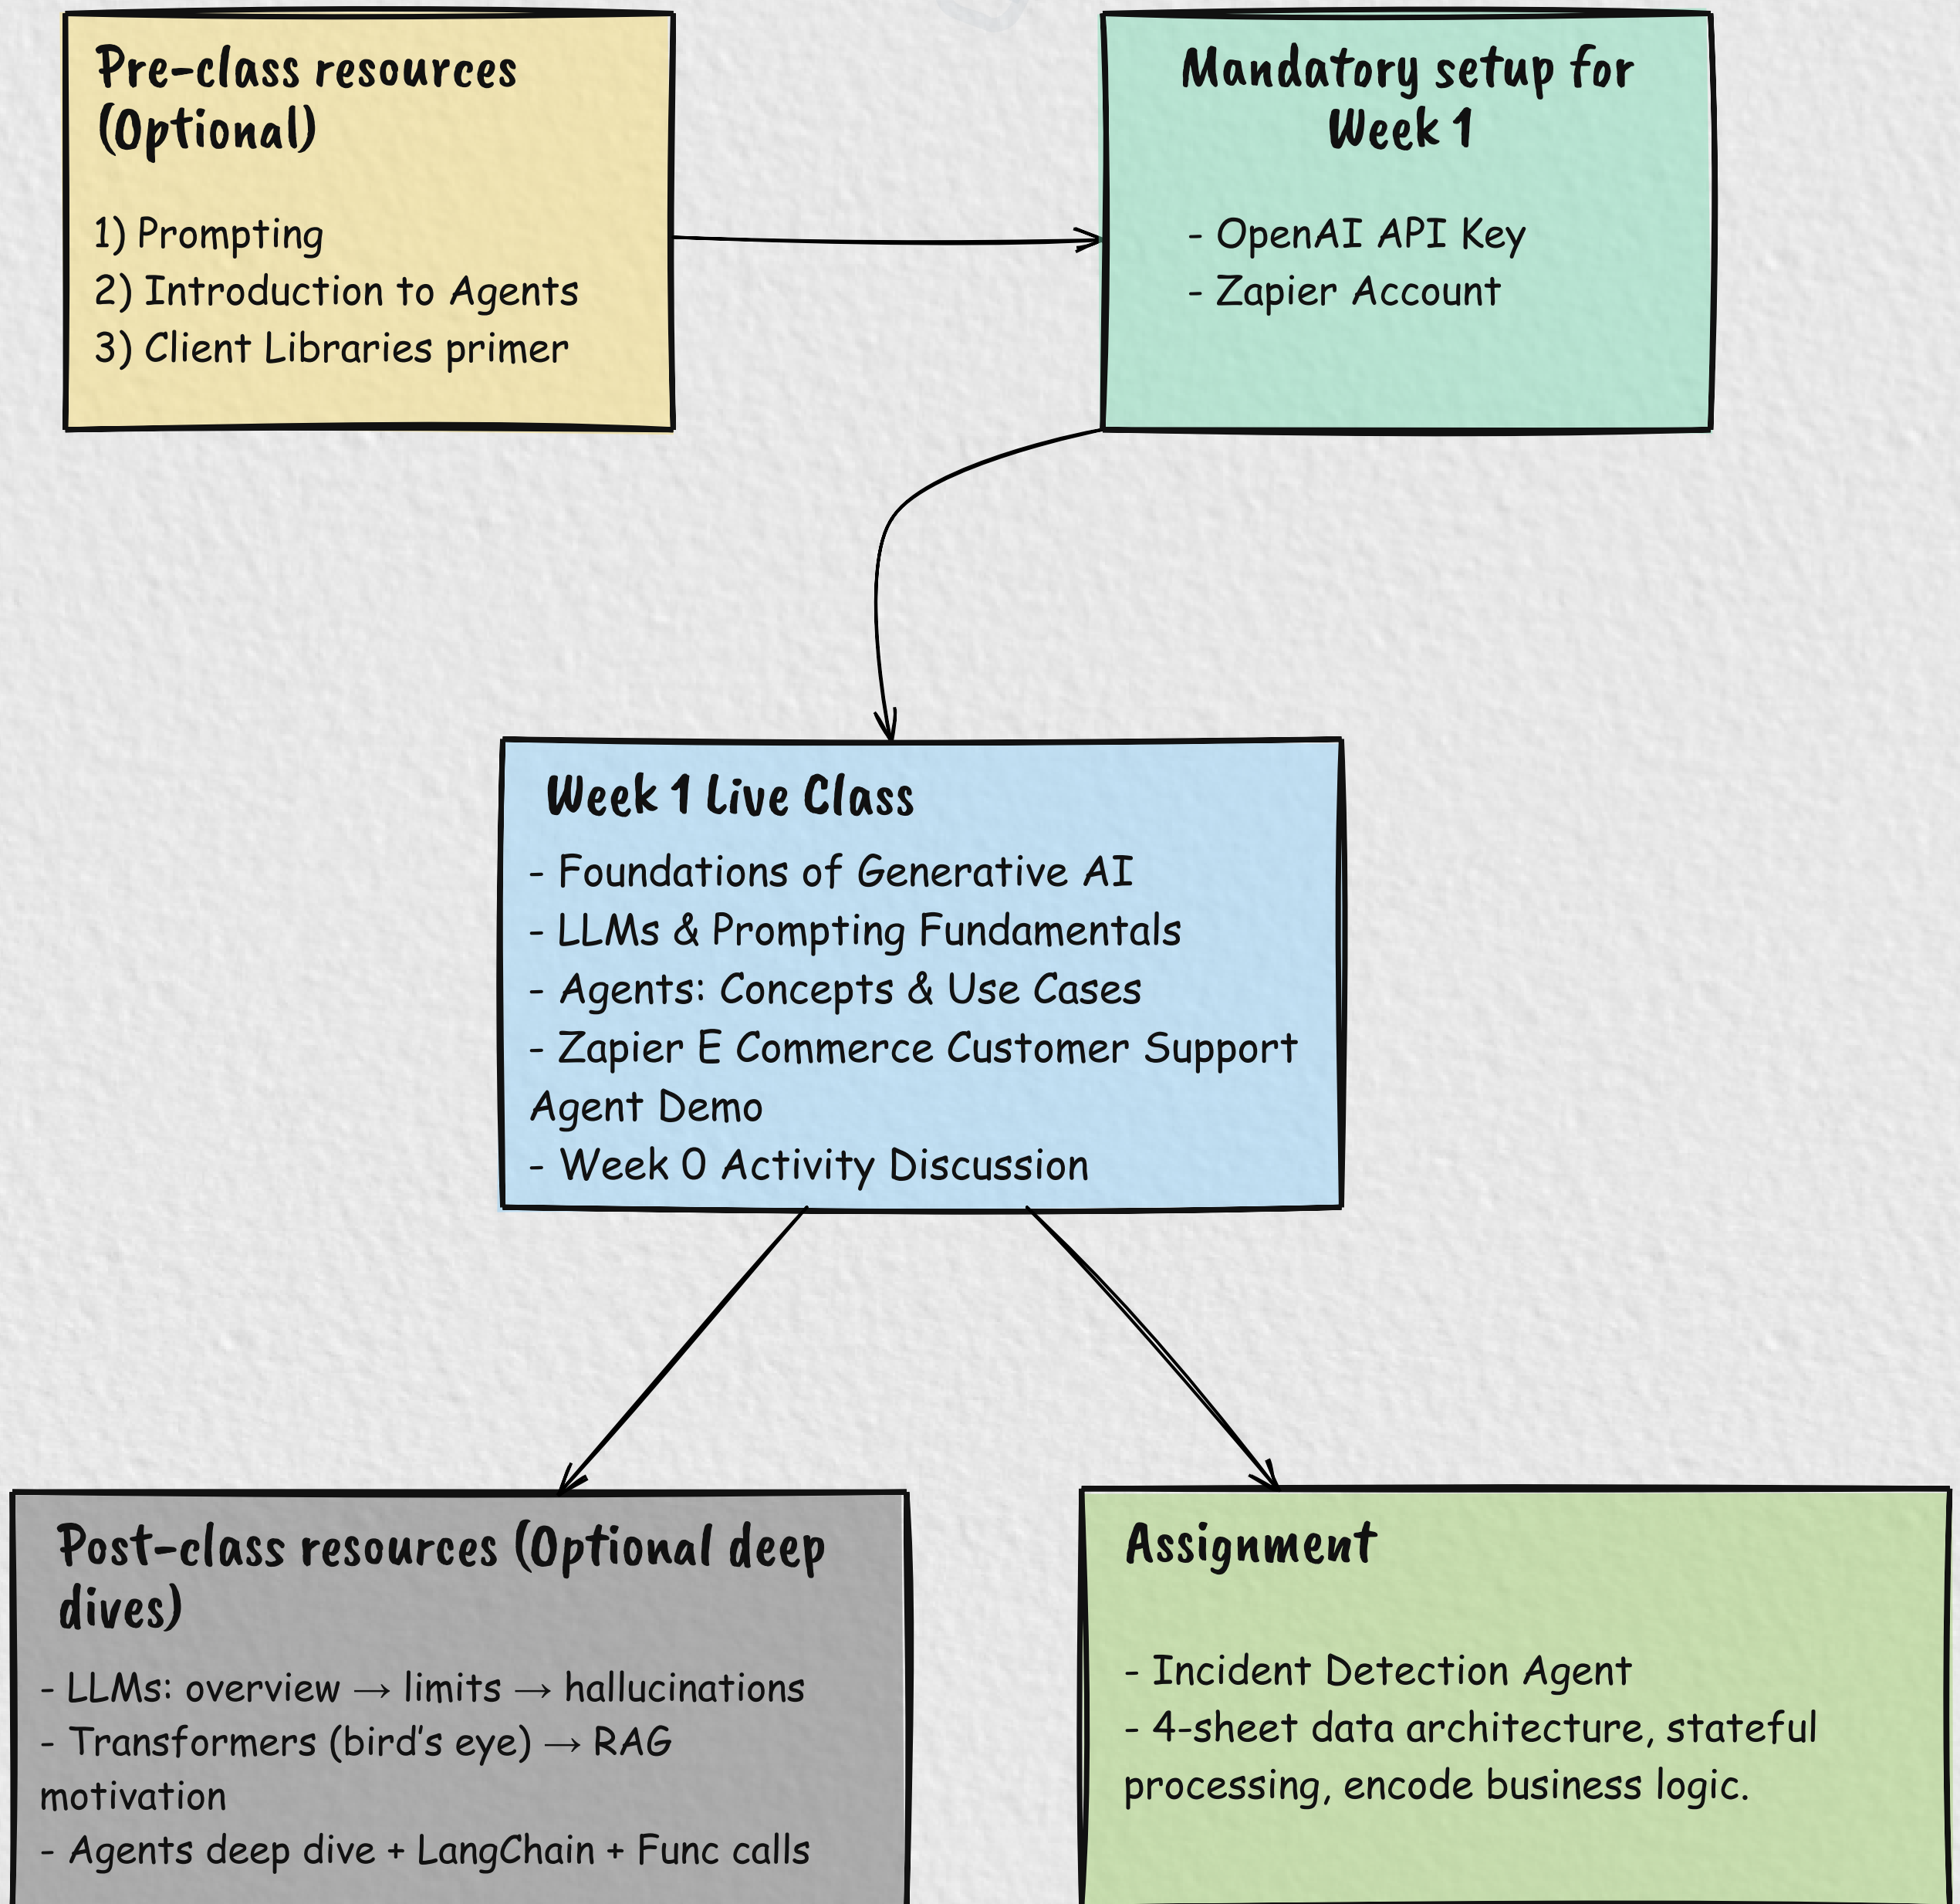

After the session, optional resources will help you deepen your understanding of LLM limitations, hallucinations, RAG, and agent design patterns like tools and planning.

Note:

Pre-class and post-class resources are optional, but the pre-class setup must be completed before the live class.

Roadmap

Please use the Wednesday AMA session to clarify any doubts you have on the topics. The assignment solutions will be discussed during the Saturday Assignment Review session.

All the resources have been added to your Uplevel account. If you have any questions, please reach out to the Operations team or raise a support ticket.
